

7.1 Before Install

This section describes the precautions to take before installing SoftEther VPN Server.

7.1.1 Checking the Operating Environment

Before installing SoftEther VPN Server to a computer, check that the computer hardware and operating system support SoftEther VPN Server.

SoftEther VPN Server supports Windows, Linux, FreeBSD, Solaris, and Mac OS X; however, this product formally supports only operating systems with Windows 2000 or later and certain Linux distributions. SoftEther VPN Server can be installed on other operating systems, but SoftEther VPN Project is not responsible for its operations. For information about the operating environment of SoftEther VPN Server, please refer to [Specifications](#).

Before installing SoftEther VPN Server, be sure to back up data stored in the installation directory of the computer (including the system registry in Windows).

7.1.2 Hard Disk Space

As described in [3.10 Logging Service](#), SoftEther VPN Server writes large operation log files to the hard disk during operation. In addition, when the hard disk space reaches a certain size, VPN Server deletes the oldest log files written to the hard disk during VPN Server operation.

Although the data size of logs written by VPN Server varies greatly depending on the operation status of VPN Server, the number of users connected on a daily basis, and the selection of saved packet log items configured by the Virtual Hub administrator, as a guideline, it is a good idea to have between 30 and 100 GB of available disk space when using VPN Server for a general remote-access VPN or for a VPN connection between bases.

7.1.3 CPU Processing Speed

The processing speed of VPN Server depends on the CPU speed. Therefore, check that the CPU speed of the hardware you want to use as the VPN server computer has sufficient speed. If the CPU speed is too slow, we recommend upgrading the system.

As a guideline for the CPU speed, we recommend providing a CPU with a speed of 2.0 GHz or faster when connecting to a network using a physical line with a communication

speed of 100 Mbps. If the CPU speed is too slow, the communication delay time may increase and throughput may decrease.

7.1.4 Conflicting Software

It is essential that you make sure that the operation speed of VPN Server is not adversely affected and server operations are not disrupted by software conflicts that can occur when VPN Server is installed on a computer with a personal firewall or antivirus software from a different manufacturer. If there are signs that the VPN functions are not operating properly due to a conflict with this type of software, we recommend temporarily disabling that software and try operating VPN Server again.

Please note that VPN Server conflicts with VPN Bridge. Generally, VPN Bridge does not need to be installed on the same computer on which VPN Server is installed.
