Remaining Configuration Files and Log Files.

8.3.2 Virtual Network Adapter

The Virtual Network Adapter created by the user when using VPN Client remains on the computer after VPN Client is uninstalled, in the same way document files created by the user when using a regular application remain on the computer after that application is uninstalled. This is to prevent the deletion of the Virtual Network Adapter settings configured by the user when VPN Client is uninstalled.

The Virtual Network Adapter that remains on the computer after uninstallation can be deleted using the Device Manager of Windows.
